Background

A local firm, EventHub Corporation, has been successful in selling tickets to attend events. The company got its start working with local high schools and selling tickets to football games. They then branched out to the local colleges and started selling tickets to their sporting events and other things that were happening on campus. This then led them to get contracts to sell tickets for musical acts that were coming to town and the company has been growing ever since.

They have realized that they have a problem. The way that they have been advertising their tickets and then taking sales online is starting to become overwhelmed by the company's growth. The good news is that they know that they have a problem, the bad news is that they are not completely sure how they can go about solving it.

They have created a team of both company insiders and representatives from their customers to discuss what kind of solution they need. The people who participated in this discussion were:

1. Adaeze Okafor (Host) – Product Director for EventHub Ticketing
2. Marcus Bell (PM) – Product Manager
3. Thuy Nguyen – Quality Assurance (QA) Representative
4. Kenji Tanaka (Sec) – Cybersecurity Expert
5. Darnell Washington – Launch Customer / Student Entertainment Director at USF (managing 26,000 students)

They've had some very good discussions where they've covered both what they are looking for and the potential issues with a solution that they can anticipate. These discussions have been recorded and will be made available to you.

Description Of Your Assignment:

As a software engineer who is working in the new world where GenAI tools exist to help you be more productive, you will need to understand what the customer wants and then, using GenAI tools correctly, you will need to quickly create the solutions that the customer is looking for.

It will be important for you to remember that the GenAI tools that you use will create answers if you ask them to – they just might not be the right answers for your customer. What this means for you is that you are going to have to take the time to carefully describe your problem to a GenAI tool and then once it has created a solution for you, you will need to carefully review it and make sure that it does not contain any errors.

What You Need To Do:

For each assignment that you will be given, you need to understand that your manager expects you to complete the work quickly and accurately. Obviously yes – you can use GenAI tools to do these assignments and in fact that is the key to this project. However, where things start to get tricky is that

accurately thing. Your boss could drop assignments into a GenAI tool just as easily as you can. Where you come in is that you are smart enough to make sure that only high quality inputs are given to the GenAI tools and then you take the time to review what they tell you to identify any mistakes, hallucinations, or made up (and wrong) solutions.

End Result:

You will turn in an answer to each of the assignments. However, you need to be careful here – the output from one assignment will become the input for the next assignment. Do you understand how the result was created? Will you be able to detect any errors that your input causes in the next phase?

The purpose of this assignment is to provide you with an opportunity to work through the entire software engineering lifecycle using GenAI tools. The goal is to provide you with an opportunity to see how quickly and accurately you can complete the work. If you can get good at doing this, then you'll be well prepared to go out and get a job doing it!
